

Custom Aptamer Sequences

Aptagen updated its library of products to include over 300 custom-order aptamer sequences. This network of sequences can be used in applications including drug discovery, therapeutics, and diagnostic and biomarker tools. Due to their production times and batch-to-batch consistency, aptamers are becoming a viable alternative to traditional antibodies. The benefits continue post-synthesis too, as aptamers exhibit higher binding affinity and specificity than antibodies. Aptagen's library of sequences can be used for targeting small organics, peptides, proteins, viruses, cells, and bacteria.
